

# SecureINTEL

Seccom Global's SecureINTEL is a powerful, cost effective and seamless way to implement and take advantage of the many benefits to be found with a Security Information Event Management - SIEM solution monitoring your network.

Protecting your network against today's rapidly evolving threat landscape requires broad and complete visibility across the entire IT environment. Evidence of what has occurred on your network and when this has occurred exists hidden within log and machine data. SecureINTEL has been designed to extract this data, to analyse it, and to present it in meaningful report formats that provide a detailed insight into threats and risks on your network to which you would otherwise have been unaware.

Some of the advantages of SecureINTEL include;

- ✓ Enabling baseline network behaviour to immediately pinpoint abnormal activity,
- ✓ Detecting unauthorised or suspicious applications,
- ✓ Assisting with network forensic investigations performing full packet capture,
- ✓ Preventing sensitive data loss,
- ✓ Shutting down suspicious activity as it is detected.

Regardless of whether you are responsible for a small business network, or you are running a global organisation, time-to-value and total cost of ownership matter. Implementing a SecureINTEL managed solution assists business to quickly leverage the powerful capabilities of SIEM while at the same time keeping implementation costs to a minimum.

SecureINTEL capabilities will allow the detection and investigation of a range of issues from the presence of malware, excessive bandwidth consumption, inconsistent network activity and inappropriate network use, botnet detection, data theft and much more.

The emergence of Bring Your Own Device – BYOD and the Internet of Everything and adding to this challenges such as an increasingly mobile workforce, means business is finding it difficult to distinguish between what is considered normal and abnormal network activity. SecureINTEL can automatically establish profiles for users and determine what is considered acceptable behaviour and observe for what is abnormal. When a user deviates from normal behaviour characteristics such as accessing significantly different data, SecureINTEL can automatically respond in accordance with predetermined strategies.

## Why Invest In SecureINTEL?

The most compelling reason to invest in SecureINTEL is that it will reduce cost to your organisation and improve your outcomes and workloads significantly. In any one day there are numerous events occurring on a network, even the smallest of networks can have thousands of events occur. SecureINTEL will capture and correlate all of these events and automatically analyse this information into meaningful outputs that will significantly increase effective detection of issues. What SecureINTEL can achieve automatically in moments would take hundreds if not thousands of man hours to achieve manually. No matter how good a security engineer is 1,000 events per day is a practical maximum amount of events any one person can deal with, even a small to medium business with just a few devices can have over 100,000 events per day!

SecureINTEL will let you know what is happening on your network, when it has happened and how it occurred. In a modern network visibility is a must, that is SecureINTEL!
